Heavy Duty Needle Roller Bearings

High load capacity, long life, caged roller bearings in
standard configurations and custom designs

**RBC Division

RBC Bearings Incorporated (RBC Bearings, RBC) has had a long tradition of innovation, commitment, and quality since the company was founded in 1919. Today, RBC Bearings has grown into a world-class manufacturer of standard and custom-engineered bearings and related products, with a product focus on research, testing, and development of the best product for specific applications.

What We Manufacture

RBC Bearings, with facilities throughout North America and Europe, provides bearings and precision products for applications in the construction, mining, material handling, transportation and off-highway equipment, robotics and automation, farming, machine tool, and semiconductor equipment industries. Through RBC Aerospace Bearings, the company is a major manufacturer of highly-engineered bearings and precision products for military, defense, and commercial aerospace applications.

RBC's high-quality bearings include:

- **Heavy Duty Needle Roller Bearings** - Pitchlign® caged heavy duty needle roller bearings, inner rings, TJ TandemRoller® bearings for long life.
- **Spherical Plain Bearings** - Radial, angular, contact, high misalignment, extended inner ring, DuraLube™ maintenance-free spherical plain bearings, QuadLube® long life bearings, ImpactTuff® case carburized bearings, ShimPack® double-acting angular contact bearings, CrossLube® lubrication groove systems, and SpreadLock® Seal.
- **Cam Followers and Yoke Rollers** - Standard stud, heavy stud, yoke type, caged roller followers, RBC Roller® long life cam followers, HexLube® universal cam followers, airframe track rollers. Mastguide rollers and carriage rollers, chain sheaves (for leaf chain), toothless sprockets (for roller chain), and heavy-duty roller bearing construction.
- **Rod Ends** - Commercial and aerospace, precision, Mil-Spec series, self-lubricating, inch and metric. Heim®, Unibal®, and Spherco® brands.
- **Self-Lubricating Bearings** - Radial, thrust, rod ends, spherical plain bearings, high temperature, high loads, inch and metric. Fiberglide® brand.
- **Thin Section Ball Bearings** - Standard cross sections to one inch. Sizes to 40 inches. Stainless steel and other materials available. Seals available on all sizes and standard cross sections.
- **Airframe Control Bearings** - Ball bearing types, self-lubricating types, needle rollers, track rollers.
- **Ground, Semiground, and Unground Ball Bearings** - Full complement, utilizes design and burnished races for higher loads, long life, and smooth operation.
- **Dowel Pins, Loose Needle Rollers, Shafts**
- **Tapered Roller Bearings** - Case-hardened and through-hardened in a variety of sizes, used in Class 8 heavy truck and trailer wheel bearings, final drive transmissions and gear boxes.
- **Tapered Roller Thrust Bearings** - Case-hardened. Sealed and unsealed for truck, tractor, and construction equipment steer axles, and Class 8 trailer landing gear.
- **Ball Screws** - Precision ground, rolled, ball splines. Long life, low wear, high accuracy, QuickTurn® Ball Screw Repair Service.
- **Custom Designed Bearings** - RBC produces a wide range of custom bearings in various materials for specific applications.

RBC Heavy Duty Needle Roller Bearings

RBC produces an extensive heavy duty needle roller bearing product line from 1 inch outer ring OD to 12.125 inch outer ring OD. RBC heavy duty needle roller bearings can be found in helicopter rotors and transmissions, marine crankshafts and connecting rods, gear pumps, oil field pumping jacks, and mud pumps.

The RBC SJ series of Pitchlign® heavy duty needle roller bearings are supplied in standard envelopes in both sealed and unsealed configurations.

RBC TJ TandemRoller® heavy duty needle roller bearings increase the capacity of the standard Pitchlign® SJ series from 10% to 40% while maintaining the standard SJ envelope.

RBC inner rings can be used separately or as an inner race for complementary SJ or TJ roller bearings.

RBC produces metric roller bearings where volume permits.

How We Can Serve You

RBC has implemented a total quality control system that uses statistical quality control at all facilities, and manufactures in high volume to a just-in-time program.

To serve the ongoing needs of customers, RBC has a network of over 1,600 distributors and sales engineers throughout North and South America and Europe, with authorized agents worldwide. For assistance with your bearing application, contact:

Customer Service - 800.390.3300

Warranty

RBC products are warranted for material and workmanship for a period not to exceed 90 days from shipment and for a value not to exceed purchase price. No other warranty is in effect.

All dimensions in inches.

For matching inner rings see **page 10**

The part numbers of matching inner rings are the same as the corresponding bearing numbers, except the prefix **SJ** is replaced by the prefix **IR**

Alternate inner rings with different bores are available for several bearings.

Alternate inner rings carry suffix **-C** or **-D**.

Example: Matching inner rings for bearing **SJ 7315** (1 1/34" x 2 5/8" x 1 1/4"):

- a) **IR 7315** (1 7/16"ID x 1 3/4"OD x 1 1/4"W)
or
b) **IR 7315 C** (1 1/2"ID x 1 3/4"OD x 1 1/4"W)
Inner rings must be ordered separately

The bearings meet Military Standard MS 51961.

* These bearings have a radius at both ends of the outer ring.

All other outer rings are manufactured with a radius at one end and a break corner at the other.

All dimensions in inches.

For matching inner rings see **page 11**

The part numbers of matching inner rings are the same as the corresponding bearing numbers, except that the prefix **SJ** is replaced by the prefix **IR**.

Alternate inner rings with different bores are available for several bearings.

Alternate inner rings carry the suffix **-C** or **-D**.

Example: Matching inner rings for bearing **SJ 7355** (2" x 2 9/16" x 1 1/4"):

a) **IR 7355 D** (1 5/8"ID x 2"OD x 1 1/4"W)

or

b) **IR 7355** (1 11/16"ID x 2"OD x 1 1/4"W)

Inner rings must be ordered separately.

These bearings meet Military Standard MS 51961.

* These bearings have a radius at both ends of the outer ring.

All other RBC outer rings are manufactured with a radius at one end and a break corner at the other.

All dimensions in inches.

For matching inner rings see **page 12**

The part numbers of matching inner rings are the same as the corresponding bearing numbers, except that the prefix **SJ** is replaced by the prefix **IR**.

Alternate inner rings with different inside diameters are available for several bearings.

Alternate inner rings carry the suffix **-C** or **-D**.

Example: Matching inner rings for bearing **SJ 9688** (4" x 5" x 2") are:

- a) **IR 9688 D** (3 1/4"ID x 4"OD x 2"W)
- or
- b) **IR 9688** (3 3/8"ID x 4"OD x 2"W)
- c) **IR 9688 C** (3 1/2"ID x 4"OD x 2"W)

Inner rings must be ordered separately.

All dimensions in inches.

For matching inner rings see **pages 10-12**.

The numeric portion of a suitable inner ring part number matches the numeric component of the bearing. Inner rings with suffix **-C** or **-D** differ in inside diameter.

Example: Suitable inner rings for bearing **SJ 8447 SS** (2 1/2" x 3 1/4" x 1 3/4") are:

- a) **IR 8447** (1 15/16"ID x 2 1/2"OD x 1 3/4"W)
- or
- b) **IR 8447 C** (2"ID x 2 1/2"OD x 1 3/4"W)
- or
- c) **IR 8447 C1** (2 1/8"ID x 2 1/2"OD x 1 3/4"W).

Inner rings must be ordered separately.

Available Seal Configurations

TYPE—S

Single seal mounted in radius end of ring with sealing lip turned outward to exclude dirt.
Bearing # SJ — S

TYPE—SS

Double seal with sealing lips turned outward to exclude dirt.
Bearing # SJ — SS

TYPE—SR

Double seal with one seal mounted in chamfered end with sealing lip turned outward to exclude dirt and one seal mounted in radius end with sealing lip turned inward to retain lubricant.
Bearing # SJ — SR

TYPE—SX

Single seal mounted in chamfered end of ring with sealing lip turned outward to exclude dirt.
Bearing # SJ — SX

TYPE—R

Single seal mounted in radius end of ring with sealing lip turned inward to retain lubricant.
Bearing # SJ — R

TYPE—RR

Double seal with sealing lips turned inward to retain lubricant.
Bearing # SJ — RR

TYPE—RS

Double seal with one seal mounted in chamfered end with sealing lip turned inward to retain lubricant and one seal mounted in radius end with sealing lip turned outward to exclude dirt.

TYPE—RX

Single seal mounted in chamfered end of ring with sealing lip turned inward to retain lubricant.
Bearing # SJ — RX

CAUTION

1. When assembling shaft against the sealing lip, the shaft end must be chamfered.
2. For effective sealing the shaft must have a finish of 20 micro inches maximum.
3. These seals are suitable for shaft speeds of 1,000 feet per minute—higher speeds are possible but seal life is shortened.
4. This type of seal is suitable for a continuous operating temperature of 250° F. However, they will operate under intermittent temperatures of up to 300° F.
5. When ordering, be sure to designate how the seal is to be mounted by using the correct suffix—unless specified otherwise, type "SS" will be shipped.

IN SEARCH of MAXIMUM CAPACITY

The RBC TJ TandemRoller® Bearing

What more capacity will do:

The rating life of roller bearings is given by $L = \left(\frac{C}{P}\right)^{\frac{10}{3}}$ where **L** is the calculated fatigue life, **C**, the dynamic capacity, and **P**, the equivalent radial load. It is easy to see that increasing the capacity will increase the fatigue life under the same load conditions, however, the relationship between life and capacity is not linear.

To see how life changes with improved capacity and constant load, we calculate a fatigue life ratio $\frac{L_2}{L_1}$ for 2 different capacity values **C**₂ and **C**₁ using the above equation:

$$\frac{L_2}{L_1} = \frac{\left(\frac{C_2}{P}\right)^{\frac{10}{3}}}{\left(\frac{C_1}{P}\right)^{\frac{10}{3}}} \quad \text{or} \quad \frac{L_2}{L_1} = \left(\frac{C_2}{C_1}\right)^{\frac{10}{3}}$$

From this relationship or from fig. 1 we can determine for example that a 10% improvement in capacity yields a 37% improvement in calculated fatigue life, while a 20% higher capacity gives 83% more life.

Increasing the number of rollers

Next we explore the AFBMA formula for the dynamic capacity of radial roller bearings for ways to improve capacity:

$$C = f_c * (i * L_{eff} * \cos(\alpha))^{\frac{7}{9}} * Z^{\frac{3}{4}} * D_w^{\frac{29}{27}}$$

For a given bearing width, changing the number of rows of rolling elements **i** is usually not an option and the effective roller length **L**_{eff} can rarely be increased any further, for radial bearings **cos(α) = 1** and the roller diameter **D**_w can be increased only so much, before the outer ring wall thickness or the cage bar become too thin. This leaves only the factor **f**_c and the number of rollers per row **z** for modification to boost capacity.

Full complement of rollers

Although a full complement bearing design has the most rollers, factor **f**_c is a maximum for a bearing with cage and modified line contact between rollers

and raceways. Full complement bearings are more sensitive to misalignment, have a greater coefficient of friction and therefore generate much more heat. Their speed limit is lower and they require re-lubrication more often because they have not only less space for lubricant storage, but use up the smaller amount of lubricant more rapidly than caged designs.

The Tandem Roller Bearing (TJ-series) solutions.

The patented RBC solution to this dilemma has been to design and make a caged bearing with 2 rollers per cage pocket. The tandem rollers are still properly guided, while the cage retains sufficient strength. The improvement in capacity over a bearing with 1 roller per pocket typically ranges from 10% to 40%, giving 37% to 200% greater fatigue life.

This improved bearing performance has been used successfully in many critical applications, for example, helicopter blade bearings, gear and mud pump bearings, suspension bearings, and many others.

TJ bearing designs are shown in the following pages in this catalog. Contact RBC when applying a TJ bearing in your design.

TECHNICAL DATA

1. Introduction

The methods, equations, and technical data presented in this section should be sufficient to select the correct bearings and estimate their performance for a wide range of applications. For applications with severe or unusual operating conditions, RBC is prepared to provide an in-depth analysis and recommend the most suitable bearing arrangement. Where standard bearings cannot be used, RBC can meet the application requirements with a special bearing design, specifically tailored for optimum performance.

2. Capacity and Fatigue Life of Roller Bearings

DYNAMIC CAPACITY C [lbf,N], or “basic load rating” for a roller bearing is that calculated, constant, radial load, which a group of apparently identical bearings with a stationary outer ring can theoretically endure for a fatigue life of 10^6 revolutions of the inner ring.

STATIC CAPACITY C_O [lbf,N], or “static load rating” is that uniformly distributed static radial load, which produces a maximum theoretical contact stress of 4000 MPa (580,000 psi).

FATIGUE LIFE, L_{10} [rev, hrs], is a statistical measure of the life which 90% of a large group of apparently identical bearings will complete or exceed. For a single bearing, L_{10} also refers to the life associated with 90% reliability.

Median Life, L_{50} is usually not more than five times L_{10} .

The relationship between rating life, capacity and load is:

$$L_{10 \text{ rev}} = \left(\frac{C}{P_e} \right)^{\frac{10}{3}} \quad \text{with } \begin{array}{l} L_{10} = \text{rating life } [10^6 \text{ rev}] \\ C = \text{dynamic capacity } [\text{lbf, N}] \\ P_e = \text{equivalent load } [\text{lbf, N}] \end{array} \quad (1)$$

(See Section 3.1)

To obtain the rating life in [hrs], use

$$L_{10 \text{ hrs}} = \frac{16667}{n_e} * \left(\frac{C}{P_e} \right)^{\frac{10}{3}} \quad \text{with } n_e = \text{equivalent speed } [\text{rpm}] \quad (2)$$

(See Section 3.1)

The equations are valid in the range of approximately 100 hrs to 100,000 hrs of life. At the low end, extreme loads or speeds may adversely affect life, at the high end, metal fatigue may never be a factor in bearing service life.

2.1 Required Bearing Load Capacity

Solving eq.(2) for the dynamic capacity C , we find:

$$C_{\text{req}} = P_e * \left(\frac{L_{10} * n_e}{16667} \right)^{0.3} \quad (3)$$

Use for applications, where a bearing must last a certain number of hours under given load and speed conditions.

Normally, bearings with rigidly mounted outer rings can support static loads up to the static capacity without detriment. The static load limit may also be used to evaluate momentary shock loads in dynamic applications and the maximum load at very slow rotation or oscillation, e.g.:

$$n_{\text{slow}} = < \frac{4}{d} \quad \text{d is the bearing inside diameter [in]} \quad (4)$$

2.2 Adjustments to Bearing Capacity

2.2.1 Raceway Hardness

The capacities given in the dimensional table are valid only if all load carrying bearing components are properly heat treated to a minimum hardness of HRc 58. The equivalent strength of material is approximately 300,000 psi. In applications without an inner ring, the shaft becomes an integral bearing component.

If one or more bearing components possess a hardness of less than HRc 58, both dynamic and static capacities must be reduced by factors given in table 1. A hardness of less than HRc 40 is not recommended.

The adjusted bearing capacities C' and C'_O become

$$\text{Adjusted dynamic capacity: } C' = f_{HD} * C \quad (5)$$

$$\text{Adjusted static capacity: } C'_O = f_{HS} * C_O \quad (6)$$

2.2.2 Operating Temperature

RBC roller bearings without seals and metallic cages are heat stabilized and may be used at operating temperatures between -40° F (-40°C) and +300° F (150° C) with no loss of capacity. Where applicable, temperature limits of seals, cage, and lubricant must be considered.

Successful operation at higher temperatures requires a different heat treatment, which reduces hardness proportionally. Alternatively, more temperature resistant bearing materials can be substituted. Consult with RBC Engineering for recommendations and hot hardness factors.

Hardness HRc	Hardness HV	Dynamic f_{HD}	Static f_{HS}
58	655	1.00	1.00
56	617	.88	.99
54	580	.77	.97
52	545	.67	.94
50	513	.59	.90
48	485	.51	.85
46	458	.43	.76
44	435	.37	.68
42	413	.31	.60
40	393	.26	.55

Table 1. Capacity reduction factors

2.3 Thrust Capacity of Radial Cylindrical Roller Bearings

Depending on internal design and operating conditions, cylindrical roller bearings can support considerable thrust loads, which makes them suitable for use as locating bearings. The main design criterion is the length to diameter ratio of the roller itself. Bearings equipped with roller lengths more than 2.5 times the diameter are called needle roller bearings and should not be used to support thrust loads.

The maximum permissible thrust load is given as a percent of the actual radial load applied and depends on speed and lubrication conditions. It is generally safe to allow a dynamic thrust load equal to 10% of the radial load.

2.4 Adjustments to Fatigue Life

If bearing design and operation deviate significantly from normal, it may be necessary to use additional factors to estimate the fatigue life L_{na}

$$L_{na} = a_1 * a_2 * a_3 * L_{10} \quad (7)$$

where L_{na} = adjusted rating life [hrs, rev]
 a_1 = reliability factor (see table 2)
 a_2 = material factor
 a_3 = user operating factor

Reliability %	L_n	Reliability Factor a_1
90	L_{10}	1
95	L_5	0.62
96	L_4	0.53
97	L_3	0.44
98	L_2	0.33
99	L_1	0.21

Table 2. Reliability Factors, a_1

The materials and bearing technology factor $a_2 = 1$ for standard bearings. Adjustment factor a_3 takes into account unusual or extreme operating conditions such as shock loads, misalignment, and lubrication. RBC rollers are crowned to reduce the danger of roller end loading and to allow for misalignment of up to 4' (0.0012 in/in). Greater misalignment or moment loading result in stress concentrations, which may reduce the rating life significantly. Consult with RBC for a detailed analysis.

3. Equivalent bearing speed and load

3.1 Mean effective bearing speed

A mean effective bearing speed n_e [rpm] must be calculated for bearings subject to variable loads and speeds within a duty cycle. It is the weighted average of all individual speed components.

$$n_e = \sum \left(\frac{n_i * t_i}{100} \right) \quad (8)$$

$$= \frac{n_1 * t_1}{100} + \frac{n_2 * t_2}{100} + \dots \quad \text{where } n_i = \text{individual speed [rpm]} \\ t_i = \text{time interval in [\%] of total time}$$

3.2 Equivalent bearing load

The general equation to compute the equivalent bearing load P_e is:

$$P_e = \sqrt[q]{\sum \left(\frac{F_i^q * n_i * t_i}{n_e * 100} \right)} \quad (9)$$

$$= \sqrt[q]{\frac{F_1^q * n_1 * t_1}{n_e * 100} + \frac{F_2^q * n_2 * t_2}{n_e * 100} + \dots}$$

In the special case of constant speed this equation reduces to:

$$P_e = \sqrt[q]{\sum \left(\frac{F_i^q * t_i}{100} \right)} \quad (10)$$

$$= \sqrt[q]{\frac{F_1^q * t_1}{100} + \frac{F_2^q * t_2}{100} + \dots} \quad \text{where } q = 10/3 \text{ for roller bearings} \\ F_i = \text{individual radial load [lbf, N]}$$

If the bearing is subject to repeated shock or impact loads, the equivalent load P_e or its individual components should be multiplied by a suitable shock load factor. The product of load and shock load factor should not exceed the bearing static capacity to prevent brinelling of raceways and rollers.

Loading	Shock Load Factor
Uniform and constant	1.00
Variable and light shock	1.50
Vibration and moderate shock	2.00
Heavy and severe shock	3.00

Table 3. Load Modification Factors

4. Limiting Speed

The limiting speed values in the dimensional tables apply to bearings lubricated with oil of proper viscosity, operating under low to medium load. Poor cooling conditions, bearing misalignment, and improper diametral bearing clearance will cause the bearing to heat up and reduce the maximum permissible speed. Grease lubricated bearings should not exceed 65% of the values given in the tables. The maximum speed of bearings with contacting lip seals is generally limited to a lip surface speed of 1000 ft/min.

5. Shaft & Housing Fits

The dimensional tables list loose and interference fits for inner and outer rings. The correct fit depends on type and severity of the load. To prevent rotation and wear, the ring subject to rotating loads must be press fitted. This will be the inner ring in most applications. The ring subject to a stationary load may be loosely fitted.

The housing interference fit ISO N7 given in the tables covers most applications with normal loads to 25% of dynamic capacity and light to moderate shock loads. Higher loads, or heavy shock loads, or thin-walled housings may require a tighter interference fit, e.g. ISO P7.

Likewise, loads above 25% of dynamic capacity, or heavy shock loads, or a hollow shaft may require a shaft interference fit per ISO n6. To determine tolerances per P7 or n6, proceed as follows: The nominal housing bore is the maximum bearing outside diameter, the nominal shaft diameter is the maximum inner ring inside diameter. Find the nominal housing bore diameter or shaft diameter respectively in table 4 and add the tolerances to the nominal dimension.

Nominal Bearing OD Range[in]	Upper & Lower Tolerance ISO P7		Nominal Inner Ring ID Range[in]	Upper & Lower Tolerance ISO n6	
3/4 - 1 1/8	-.0006	-.0014	1/2 - 11/16	+.0009	+.0005
1 3/16 - 1 15/16	-.0007	-.0017	3/4 - 1 1/8	+.0011	+.0006
2 - 3	-.0008	-.0020	1 3/16 - 1 15/16	+.0013	+.0007
3 1/4 - 4 1/2	-.0009	-.0023	2 - 3	+.0015	+.0008
4 3/4 - 7	-.0011	-.0027	3 1/4 - 4 1/2	+.0018	+.0009
7 1/8 - 9 3/4	-.0013	-.0031	4 3/4 - 7	+.0020	+.0011
10 - 12 3/8	-.0014	-.0035	7 1/8 - 9 3/4	+.0024	+.0012
12 1/2 - 15 5/8	-.0016	-.0039	10 - 12 3/8	+.0026	+.0013

Table 4. Housing tolerance P7 and shaft tolerance n6

Due to lower stiffness, bearing inner and outer rings usually conform to the shape of shaft and housing bore respectively, with little attenuation of taper and out-of-roundness. The quality of user supplied mounting surfaces must therefore be sufficient for the intended application.

The bearing operating clearance should be checked in cases where both inner and outer rings are press fitted or where a large temperature gradient exists between shaft and housing.

The user supplied shaft is an integral part of bearings without an inner ring and must meet at least the minimum requirements for rolling element bearings: Surface hardness of HRc 58 min, surface finish 16 rms, through hardened or surface hardened 0.030 to 0.050" deep (this figure depends on bearing dimensions and load) with sufficient core hardness, roundness and taper tolerance less than 50 % of the diameter tolerance.

6. Lubrication

Lubricants serve very important purposes in rolling element bearings, they

- protect bearing surfaces from rust and corrosion.
- reduce rolling and sliding friction.
- prevent metal-to-metal contact between rollers and raceways.
- carry heat out of the bearing contact area.
- form a barrier (grease) against external contaminants.
- remove wear particles from the bearing.

Lack of lubrication or inadequate lubrication is probably the single most common cause of bearing failure.

6.1 Grease Lubrication

The following check list may be helpful in grease selection:

- Suitability for the expected operating temperature and speed. Select a lower NLGI grade for low temperature operation.
- Compatibility with other greases, oils, and rust preventatives. To be compatible, products usually must have the same type oil and thickener.
- Load carrying ability. Some high temperature greases may significantly reduce bearing load capacity.
- Resistance to water and other contaminants. Balance water repellent properties against water emulsifying and water soluble properties. Note, a water repellent grease may not be able to protect the bearing surfaces against condensation and water, which has breached the grease barrier.
- Required additives for extreme pressure (EP), aging and oxidation resistance.

Historically, greases based on different thickeners had distinctly different properties with respect to operating temperature and behavior towards water. However, modern compounding technology has improved on many of the initial limitations and blurred the distinctions. The most widely used general purpose bearing grease today is a Lithium based, mineral oil type, water emulsifying grease, NLGI grade 2, with EP and other additives.

It takes relatively little lubricant to maintain an adequate lubricating film. In many applications, relubrication every 10 - 20,000 hrs would be sufficient for that purpose alone.

In those cases where the lubricants primary function is to protect the bearing from contamination, the relubrication period must be adjusted to maintain a protective barrier at all times. There are no fixed rules as to how often relubrication should take place, it is strictly a function of the environmental conditions. The harsher the operating conditions, the shorter the relubrication period. A visual examination of the bearings may indicate the need for more grease when much of the grease collar in the seal area has been lost.

The maximum recommended quantity of grease in a roller bearing is a function of operating speed. Pumping a high speed bearing full of grease will cause overheating, possibly grease loss after melting, and eventual bearing failure due to lack of lubricant. Table 5 provides a guideline for grease fill as a percent of free interior bearing space versus the operating speed n as a percent of limiting speed n_L . Visual examination of the bearing for compliance is sufficient.

Operating speed n	Percent of speed limit n_L	Grease fill % of free space
slow	$n \leq 10\% n_L$	100%
medium	$10\% < n < 20\% n_L$	50%
high	$n \geq 20\% n_L$	10%
very high	$n \geq 65\% n_L$	(oil lube required)

Table 5. Recommended grease volume.

6.2 Oil lubrication

The more demanding bearing applications involving high operating speed, high temperatures, heat generation, need for minimum friction, etc., usually require oil lubrication.

As with grease, the primary concern when selecting an oil is its suitability for the expected operating temperature. If the viscosity at operating temperature is too low, a hydrodynamic lubricating film between rollers and raceways will be too thin to prevent metal to metal contact and the adjusted bearing life will be less than the theoretical L_{10} life. Likewise, good separation of the bearing components by a thick lubricant film can more than double the L_{10} life.

The minimum oil viscosity at operating temperature should not fall below 12 cSt. The following equation can be used for a first estimate of the film parameter Λ for needle roller bearings type SJ:

$$\Lambda = 1.6 \cdot 10^{-4} \cdot (\nu \cdot n)^{0.71} \cdot F^{1.11} \quad (11)$$

with ν = viscosity @ operating temperature [cSt]
 n = bearing speed [rpm]
 F = inner raceway diameter [in]

A film parameter $\Lambda > 1$ enhances fatigue life, $\Lambda < 1$ shortens fatigue life.

In oil sump lubrication systems, the oil level at rest should not cover more than half the diameter of the lowest roller. Bearings subject to heavy loads and speeds may develop so much heat that a recirculating oil system must be used to remove excess heat. Bearings operating near the speed limit or beyond should be lubricated with oil mist.

TYPICAL APPLICATIONS

Hoist Drum Shaft — The long slender shaft of such an application is another point with inherent misalignment and deflection. Pitchlign® bearings are indicated to maintain its free-rolling, high capacity operations under adverse conditions.

Pumping Units — Center iron and equalizer applications, with oscillating service is best served by Pitchlign® bearings. With the properly controlled and spaced rollers, creepage of the rollers and cage occur to minimize fretting corrosion and friction oxidation.

Sheave Blocks — Crown blocks and traveling blocks of portable drilling equipment use Pitchlign® bearings for ease of assembly, ease of lubrication and compactness combined with minimum friction and dependable service.

Steel Mill Equipment — Pipe handling tables use Pitchlign® bearings for maximum capacity, minimum friction, compactness, ease of lubrication and maintenance-free service.

Gear Pumps — Higher pressures and speeds of today's efficient gear pumps, more than ever demand an individually controlled roller design of a bearing such as Pitchlign®. The deflection due to the high internal hydraulic loading, together with the inherent problem of alignment cannot be taken care of by any other type bearing.

Paper Converting Machines — To maintain today's fabulous output of paper converting machinery, Pitchlign® bearings are used on the eccentrics and main bearings of paper punch presses where they withstand speed, heavy impact and shaft deflection.

Machine Tools — One such application is the planet gears and mainshaft bearings of a clutch drive of a mechanical press. Pitchlign® bearings are ideally suited for planet gear applications where centrifugal force and torsional deflection of the planet cage is present. Pitchlign® bearing cages are supported by the integral outer ring flanges, maintaining proper guidance of individual rollers, regardless of the centrifugal force.

Textile Machinery — Calender rolls, where space is a problem, is another place where the Pitchlign® bearing with its maximum capacity, minimum size and thrust free operation fulfills all requirements. The sealed Pitchlign® bearing also assures stain-free batts.

Power Transmission — In gear boxes and transmissions of all types, the Pitchlign® bearing is used due to its maximum capacity, minimum size and thrust free service. The sealing feature of the sealed Pitchlign® bearing simplifies design, assembly and inventory of parts.

Pitchlign® Aircraft Bearing applied to the horizontal hinge of an early model helicopter rotor. The shaft, being cantilevered, introduces a severe deflection problem. The Pitchlign® bearing, with its individually controlled rollers prevents skewing and locking even with the severe end loading present.

Pitchlign® Aircraft Bearing mounted in a universal joint type design of intersecting horizontal and vertical hinges of a helicopter. The minimum dimensions and maximum capacity plus the creepage of the rollers and cage under oscillating service makes the Pitchlign® bearing an ideal bearing for such applications.

Pitchlign® Application Sheet

Name: _____ Title: _____ Date: _____

Company: _____ Address: _____

City: _____ State: _____ Zip: _____

Application: Currently in use: _____ New: _____

If currently in use, what bearings are now being used? _____

Manufacturer: _____ Part No.: _____

Equipment bearings to be used on: _____ Model No.: _____

No. bearings per operating unit: _____ Anticipated requirements per year: _____

Operating Temperature: _____ Speeds: _____

Loads: _____ Desired L-10 Life: _____

(Magnitude & Direction)

Intermittent (Describe): _____ Shock: _____

Shaft:

Horizontal: _____ Angular: _____ Oscillating (Angle: _____) Vertical: _____

Rotating: _____ Stationary: _____ Potential shaft or housing deflection: _____

Degree of expected misalignment: _____ Housing Material: _____

Shaft Material: _____ Shaft Heat Treat (Inner race omitted): _____

Lubrication:

Type: _____ Method: _____ Cycle: _____

If CF type, are all oil holes needed? Yes: _____ No: _____

For Gear Pump Calculations, the following additional information is required:

Operating pressure in PSI: _____ RPM: _____

No. of Teeth: _____ Gear Pitch: _____ Gear Width: _____

Percentage or time of duty at operating pressure - Test Basis: _____

Percentage or time of duty at operating pressure - Field Basis: _____

For Gear Trains, the following additional information is required along with a print:

Horsepower Input: _____ Distance between Gears: _____ Helix Angle: _____

Input Speed: _____ Pitch Diameters: _____ Spiral Angle: _____ No. of Teeth: _____

If Spiral or Helical Gearing:

Direction of Driving Pinion: _____ Hand of Spiral or Helix: _____

CUSTOM DESIGNED BEARINGS

As we mentioned earlier in this reference catalog, in addition to our complete line of standard bearings, RBC also will manufacture many other bearings of a highly specialized nature for specific applications. As each special bearing is engineered for a particular set of operating conditions, it is essential that we have complete data regarding the application, including potential production volumes.

Shown below are just a few of our custom designed Bearings.

**Helicopter Rotor Bearing with
Inner Ring M50 Steel**

Aircraft Transmission Bearing

**Reverse Idler Bearing
Truck Transmission**

**Outboard Engine
Crankpin Bearing**

Motorcycle Transmission Bearing

Innovation. Commitment. Quality.

RBC Bearings has been producing bearings in the USA since 1919. In addition to unique custom bearings, RBC offers a full line of standard industrial and aerospace bearings, including:

Spherical Plain Bearings

Radial, angular contact, extended inner ring, high misalignment. QuadLube®, ImpactTuff®, SpreadLock® Seal, CrossLube®, DuraLube™, and self-lubricating bearings. Available in inch and metric sizes.

Thin Section Ball Bearings

Standard cross sections to one inch. Sizes to 40 inches. Stainless steel and other materials are available. Seals are available on all sizes and standard cross sections. Super duplex configurations.

Tapered Roller Bearings

Tyson® case-hardened and through-hardened tapered roller bearings. Available in many sizes. Used in Class 8 heavy truck and trailer wheel bearings, gear boxes, and final drive transmissions.

Tapered Roller Thrust Bearings

Case-hardened. Sealed and unsealed for truck, tractor, and construction equipment steer axles, and Class 8 trailer landing gear.

Ball Screws

Precision ground, rolled, ball splines. Long life, low wear, high accuracy. QuickTurn® Ball Screw Repair Service.

Integrated Assemblies

For robots and other process tool applications. Engineering design assistance. Production volume capacity.

Cam Followers

Standard stud, heavy stud, yoke type, caged roller followers. Patented RBC Roller® cylindrical roller cam followers, HexLube® universal cam followers, airframe track rollers.

Needle Roller Bearings

Pitchlign® caged heavy duty needle roller bearings, inner rings, TJ TandemRoller® bearings for long life.

Self-Lubricating Bearings

Radial, thrust, rod ends, spherical bearings, high temperature, high loads. Available in inch and metric sizes. Fiberglide® self-lubricating bearings.

Airframe Control Bearings

Ball bearing types, self-lubricating types, needle roller track rollers.

Dowel Pins, Loose Needle Rollers, Shafts

Precision Products dowel pins, loose needle rollers, and shafts.

Commercial Rod Ends

Commercial and industrial, precision, Mil-Spec series, self-lubricating, and aircraft. Sold under the Heim®, Unibal®, and Spherco® brands. Available in inch and metric sizes.

Ball Bearings

Precision ground, semi-ground, unground. High loads, long life, smooth operation. Nice® ball bearings are offered in caged and full complement configurations.

Specials

RBC manufactures many specialty bearings for the aerospace, oil and energy, semiconductor equipment, packaging, transportation, and other industries.
