DEEP GROOVE BALL BEARING

DEEP GROOVE BALL BEARING

Deep groove ball bearing is the most common type of rolling bearings.

The basic deep groove ball bearing is composed of an outer ring, an inner ring, a group of steel balls and a group of retaining structures. There are two types of deep groove ball bearings: single row and double row. The deep groove ball structure is also divided into sealed and open structures. Open type means that the bearing does not have a sealed structure, and the sealed deep groove ball is divided into dust seal and oil seal. The material of the dust-proof sealing cover is steel plate stamping, which only plays a simple role in preventing dust from entering the bearing raceway. The oil proof type is a contact oil seal, which can effectively prevent the grease in the bearing from overflowing.

The type code of single row deep groove ball bearing is 6, and the code of double row deep groove ball bearing is 4. With simple structure and convenient use, it is the most popular and widely used bearing.

SELF ALIGNING BALL BEARING

SELF ALIGNING BALL BEARING

Self aligning ball bearings have two structures: cylindrical hole and conical hole. The material of cage includes steel plate, synthetic resin, etc. Its characteristic is that the outer ring raceway is spherical, with automatic centering, which can compensate the errors caused by different centrality and shaft deflection, but the relative inclination of its inner and outer rings shall not exceed 3 degrees.

Figure 1 shows two schematic diagrams of specimens, labeled (a) and (b). Both diagrams show a vertical rectangular specimen with a central square hole and two circular holes, one above and one below the square hole. The width of the specimen is labeled B , the total height is labeled D , and the height of the central square hole is labeled d . In diagram (a), the circular holes are solid. In diagram (b), the circular holes contain internal features, possibly representing different material properties or internal structures.

CYLINDRICAL ROLLER BEARING

CYLINDRICAL ROLLER BEARING

The cylindrical roller and raceway are linear contact bearings. Large load capacity, mainly bearing radial load. The friction between the rolling element and the ring rib is small, and it is suitable for high-speed rotation. According to whether the ring has rib or not, it can be divided into NU, NJ, NUP, N, NF and other single row cylindrical roller bearings, and NNU, NN and other double row cylindrical roller bearings. The bearing is a separable structure of inner ring and outer ring.

Cylindrical roller bearing without rib on inner or outer ring, whose inner ring and outer ring can move relative to each other in axial direction, can be used as free end bearing. Cylindrical roller bearing with double ribs on one side of the inner ring and outer ring and single rib on the other side of the ring can withstand axial load in one direction to a certain extent. Generally, pressed steel cages or solid copper alloy cages are used. However, some of them use polyamide shaped cages.

SPHERICAL ROLLER BEARING

SPHERICAL ROLLER BEARINGS

The self-aligning roller bearing has two rows of rollers. The outer ring has one common spherical raceway, and the inner ring has two raceways, which are inclined to form an angle with respect to the bearing axis. This ingenious structure enables it to have automatic centering performance, so it is not vulnerable to the influence of the angle between the shaft and the bearing housing on the error or shaft bending. It is suitable for the occasion where the angle error is caused by installation error or shaft deflection. The bearing can not only bear the radial load, but also bear the axial load of two-way action.

The inner holes of the self-aligning roller bearings are cylindrical and conical, and the taper of the conical hole is 1:30 and 1:12. The conical inner hole bearing is equipped with a locking sleeve or a withdrawal sleeve, so that the tapered inner hole self-aligning ball bearing can be conveniently and quickly assembled on the smooth shaft or the ladder machine shaft.

ANGULAR CONTACT BALL BEARING

Six types of bearings (also known as angular contact bearings) are generally used in precision machine tools and can work at a higher speed. The larger the contact angle, the higher the axial bearing capacity. High precision and high-speed bearings usually take a contact angle of 15 degrees. Under the action of axial force, the contact angle will increase. Single row angular contact ball bearing can only bear axial load in one direction, and additional axial force will be caused when bearing radial load.

**TAPERED
ROLLER BEARING**

TAPERED ROLLER BEARING

The tapered roller bearing belongs to the separation type bearing. The inner and outer rings of the bearing have tapered raceways. This kind of bearing can be divided into single row, double row and four row tapered roller bearings according to the number of rows of rollers. Single row tapered roller bearing can bear radial load and single direction axial load. When the bearing bears the radial load, it will produce an axial component force, so it needs another bearing that can bear the axial force in the opposite direction to balance.

The structure, assembly dimension accuracy and rotation accuracy of English tapered roller bearings are different from those of metric bearings. It is mainly used for imported machinery or industries with special needs.

The British tapered roller bearing refers to the tapered roller bearing whose overall dimensions are measured in inches, originated from Britain and the United States;

Structure: single column, double column and four columns

THRUST BALL BEARING

THRUST BALL BEARING

Composition of thrust ball bearing: the thrust ball bearing consists of race, shaft ring and steel ball cage assembly. The shaft ring matched with the shaft and the seat ring matched with the housing.

It can be divided into one-way thrust ball bearing and two-way thrust ball bearing according to the stress condition. One way thrust ball bearing can bear one-way axial load. The bi-directional thrust ball bearing can bear bi-directional axial load, and the shaft ring is matched with the shaft. The bearing with spherical mounting surface of the race has the self-aligning performance, which can reduce the influence of installation error. The thrust ball bearing cannot bear the radial load, and the limit speed is low.

Purpose of thrust ball bearing: it is only applicable to the machine parts bearing one side of axial load and low speed, such as crane hook, vertical water pump, vertical centrifuge, jack, low-speed reducer, etc. The shaft ring, race and rolling element of the bearing are separated and can be assembled and disassembled separately.

THRUST ROLLER BEARING

THRUST ROLLER BEARING

The thrust roller bearing is used to bear the combined axial and radial loads mainly including axial load, but the radial load shall not exceed 55% of the axial load. Compared with other thrust roller bearings, this kind of bearing has lower friction coefficient, higher rotating speed and self-aligning performance

The stick of 29000 type bearing is an asymmetric spherical roller, which can reduce the relative sliding of the roller and raceway during operation. The roller is long, large in diameter, large in number and high in load capacity. It is usually lubricated with oil, and can be lubricated with grease in some low speed cases. Priority shall be given to selection in design;

80000 type thrust cylindrical roller bearing, 90000 type thrust tapered roller bearing and AXK type thrust needle roller bearing can withstand unidirectional axial load, which is much greater than the axial load capacity of thrust ball bearing, and has large rigidity and small axial space occupation.

THRUST SELF-ALIGNING ROLLER BEARING

[illegible]

[illegible][illegible]

INSERT BEARING

The outer spherical ball bearing is actually a variant of the deep groove ball bearing. Its outer diameter surface is spherical, which can be fitted into the corresponding concave spherical surface of the bearing seat to play the role of centering. The outer spherical bearing is mainly used to bear the combined radial and axial load, and it is not suitable to bear the axial load alone.
